DISSERTATION

to obtain
the degree of doctor at the University of Twente,
on the authority of the rector magnificus,
Prof. Dr. H. Brinksma,
on account of the decision of the graduation committee,
to be publicly defended
on Friday the nth of September 20XX at XX:XX

by

Introduction

Turbulence is omnipresent. It's in our blood, in our respiratory system, in our tea and coffee, in the hot air that rises above us, in the wake behind us when we walk, in the air in a room, around our cars and planes, in the wind above our farmlands, in the water of all the seas and oceans, in our sun, and in all the other stars.

For macroscopic flows of water and air the Reynolds number, the ratio of inertial to viscous forces and describing the amount of turbulence, is generally much larger than unity. This means practically that all the common flows around us are turbulent. The difficulty in describing turbulence resides in the fact that turbulent flows are generally irregular, chaotic, and therefore very hard to predict. Think of the weather; we can only predict a few days ahead—at best. In addition, turbulent flows have characteristics across many length- and time scales, so describing them is non-trivial. Although the equations describing them are well known, it has puzzled scientists for centuries and we have not yet 'solved' turbulence.

Taylor Couette

The Taylor-Couette apparatus is one of the fundamental configurations to test theories in fluid dynamics....

A guide through the thesis

Up to now, for the high Reynolds numbers ($> 10^4$), the focus...

1.1 Introduction

The Taylor-Couette (TC) system is one of the fundamental geometries...

$$\text{Re}_w \propto \text{Ta}^{1/2} \quad (1.1)$$

1.2 Experiment

The apparatus used for the experiments has an inner cylinder...

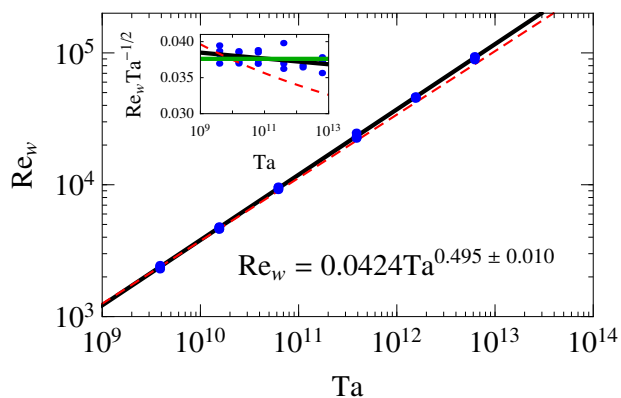

Figure 1.1: a nice image

1.3 Analysis and Results

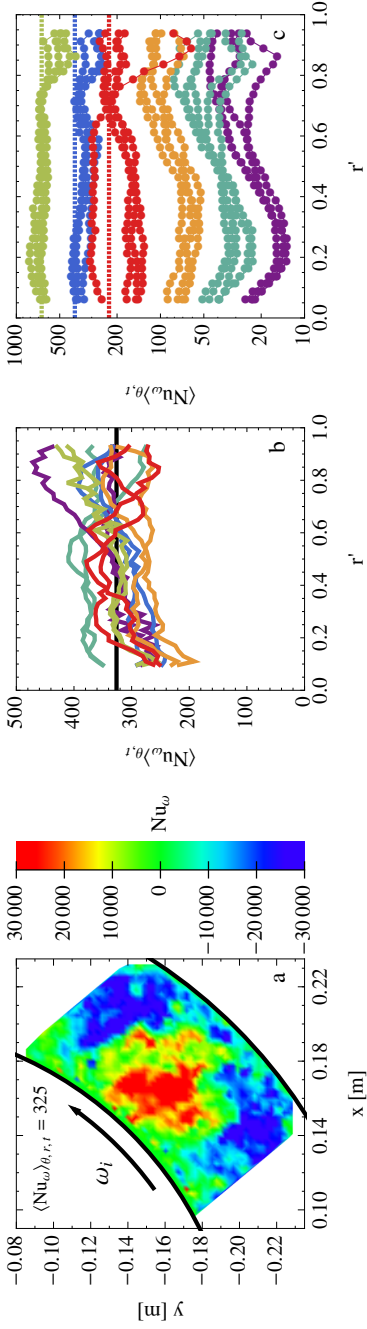

Figure 1.2: just to show you how a vertical page is done

1.4 Conclusion

In conclusion....

Conclusions

In this thesis high Reynolds number Taylor-Couette flow has been examined...
